

Meropenem vs untreated: log2 fold-change

Strain AB030, Stationary phase. Panel C: log₂ fold-change (Meropenem/untreated) per 1kb genomic window (mean of replicates A and B), plotted against normalized genomic position (x; oriC = 0, ter = ±1) -- transposed axes, same data and statistics as the vertical-line version. Horizontal lines mark 2-fold-change thresholds (log₂FC = -1, 0, +1). 4335 windows used (0 excluded for zero coverage in at least one condition): 137 above +1, 0 below -1, 4198 within ±1. Overall t-test $p = < 0.001$; overall Mann-Whitney U $p = < 0.001$ (both compare per-window mean read density, Meropenem vs untreated, pooled across all windows genome-wide as the sample).
