

Meropenem vs untreated: log2 fold-change

Strain ATCC 17978-mff, Stationary phase. Panel C: log₂ fold-change (Meropenem/untreated) per 1kb genomic window (mean of replicates A and B), plotted against normalized genomic position (y; oriC = 0, ter = ± 1). Vertical lines mark 2-fold-change thresholds (log₂FC = -1, 0, +1). 3857 windows used (0 excluded for zero coverage in at least one condition): 0 above +1, 0 below -1, 3857 within ± 1 . Overall t-test $p = < 0.001$; overall Mann-Whitney U $p = < 0.001$ (both compare per-window mean read density, Meropenem vs untreated, pooled across all windows genome-wide as the sample).
