

Genome-wide variant landscape: AB030 (FastANI = 99.9849%)

Strain AB030. Rings (outer to inner): genome position (Mb, oriC/ter marked), substitution density per 10kb window (max 589), insertion+deletion density per 10kb window (max 32), and structural rearrangements (69 shown: duplication=3, inversion=2, relocation-insertion=38, relocation-overlap=26). 212 NucDiff structural record(s) of assembly-artifact type (unaligned\_beginning/end, collapsed\_repeat(s), circular\_genome\_start, and whole-genome reshuffling-part\_1/2\_gr\_0 pairs -- the latter reflect the assembly's circular start point differing from the reference's, not real rearrangement) are excluded from the rearrangement ring. CAUTION: this hybrid assembly is fragmented (largest contig = 30.0% of total length across 153 contigs) -- SNP/indel density here is likely inflated by assembly/sequencing error in low-confidence contigs, not confirmed biological variation.
