

Genome-wide variant landscape: LAC-4 (FastANI = 99.9309%)

Strain LAC-4. Rings (outer to inner): genome position (Mb, oriC/ter marked), substitution density per 10kb window (max 1023), insertion+deletion density per 10kb window (max 58), and structural rearrangements (35 shown: duplication=1, relocation-insertion=20, relocation-overlap=14). 165 NucDiff structural record(s) of assembly-artifact type (unaligned_beginning/end, collapsed_repeat(s), circular_genome_start, and whole-genome reshuffling-part_1/2_gr_0 pairs -- the latter reflect the assembly's circular start point differing from the reference's, not real rearrangement) are excluded from the rearrangement ring. CAUTION: this hybrid assembly is fragmented (largest contig = 6.7% of total length across 151 contigs) -- SNP/indel density here is likely inflated by assembly/sequencing error in low-confidence contigs, not confirmed biological variation.
